

What is claimed is:

1. A method of manufacturing a plastic container comprising a tube of a plastic laminate, a bottom wall formed so as to be joined integrally to an inner circumference of a lower end part of the tube, a hoop formed so as to be joined integrally to an outer circumference of an upper end part of the tube, and a top cover provided with a spout and bonded to an upper end surface of the hoop, said method comprising the steps of:

forming the tube by rolling a plastic laminate in a tubular shape;

putting the tube on a mandrel;

inserting the mandrel holding the tube in a mold so that a first molding cavity connected to a runner formed in the mold, for molding the bottom wall of the plastic container is formed inside one end part of the tube and a second molding cavity connected to a runner formed in the mold, for molding the hoop is formed around the other end part of the tube;

injecting a molten resin through the runners into the first and the second cavity by an insert injection means to form the bottom wall and the hoop; and

bonding the top cover provided with the spout to an upper end surface of the hoop.
